The Marshall-Lerner condition specifies that devaluation improves the current account only if:

- ☐ a. The sum of elasticity of demand for export & the elasticity of demand for import is less than unity
- ☒ b. The sum of elasticity of demand for export & the elasticity of demand for import is greater than unity
- ☐ c. The sum of elasticity of demand for export & the elasticity of demand for import is equals to one
- ☐ d. Devaluation has no effect on current account of the domestic country

The short run equilibrium of the economy is obtained at the intersection of the aggregate demand curve and _____.

- ☒ a. Vertical long run aggregate supply curve
- ☐ b. Horizontal short run aggregate supply curve
- ☐ c. Vertical short run aggregate supply curve
- ☐ d. Horizontal long run aggregate supply curve

According to Harrod growth model, which of the following is the growth rate at which all saving is absorbed into investment?

- ☐ a. Actual growth rate
- ☐ b. Balanced growth rate
- ☐ c. Natural growth rate
- ☒ d. Warranted growth rate

Given $\alpha > 0$ and $\lim_{t \rightarrow \infty} \alpha^t$, which one of the following refers divergence from the equilibrium?

- ☐ a. $\alpha = 0$
- ☐ b. $0 < \alpha < 1$
- ☒ c. $\alpha > 1$
- ☐ d. $\alpha = 1$

Among the following hypothesis of consumption, which one emphasizes the hypothesis that people experience random and temporary changes in their incomes from year to year?

- ☐ a. The Freidman permanent-income hypothesis
- ☒ b. Hall's Random Walk Model
- ☐ c. Modigliani's Life-Cycle Hypothesis
- ☐ d. Fisher's model of Inter-temporal choice.

Given the assumptions of the classical linear regression model, Gauss-Markov Theorem states the OLS estimators are BLUE if:

- ☒ a. They have a minimum variance
- ☐ b. They are biased estimator
- ☐ c. They are non-linear estimator
- ☐ d. They have inefficient estimator

Suppose the research estimate the investment function $I = \alpha - \beta r$ and obtains the result in which of the following is inference of this result?

Which one

- ☐ a. 6% of the total variation in investment is explained by the changes in the explanatory variables unrelated to model in way
- ☐ b. 94% of the total variation of the investment attributed to error terms
- ☒ c. 6% of the total variation in investment is explained by the changes in the explanatory variables included in the model
- ☐ d. 94% the percentage of total variation of investment explained by the changes in the explanatory variables included in the model
